

DevOps Migration Exercise

ReportBridge platform migration review workbook

Context

ReportBridge is moving parts of its public edge stack into a refreshed cloud environment. The platform team wants candidates to review the migration plan and identify the riskiest operational gaps before final cutover.

Scope for review

Migration notes

- review upstream and upstream health visibility
 - migration aliases and temporary artifact exposure
 - service status communication for external customers
 - post-change validation and rollback signals
1. Confirm that the public status page reflects the new edge routing before cleanup.
 2. Remove temporary aliases only after validating customer-facing checks.
 3. Archive diagnostic outputs and migration artifacts after sign-off.

Reference edge node: edge-01

Hiring signal

Candidates should submit a short note describing what they would verify first on the external edge before declaring the migration complete.

ReportBridge Platform Team

Prepared for technical screening, March 2026

Reviewer prompts

Use these questions to structure your response.

Operational prompts

1. Which public endpoint should be checked first after the cutover?
2. Which temporary migration materials must be removed from the edge?
3. What would you log during the first 24 hours after deployment?
4. Which customer-facing signal should remain available during rollout?

Expected reviewer conclusion

The external status service must be validated first, because it exposes the customer-visible signal path during migration. Temporary artifact aliases and diagnostic endpoints should be considered high-risk leftovers until explicitly removed.

Suggested review target: `status.reportbridge.test`

Associated edge context: `edge-01 reverse proxy cutover`
